

● Electron Beam ● Gamma Rays ● Positrons ● Quantum Shower

Process Flow:

1. **LWFA (2)**: Generates high-energy electrons.
2. **Target 1 (3)**: Converts electrons to Gamma rays.
3. **Target 2 (4)**: Converts Gamma rays to Electron/Positron pairs.
4. **Magnet (5)**: Separates the beam. Positrons go to storage (8).
5. **Converter (9)**: Electrons create EM showers (10).
6. **Detector (11)**: Captures spatial/temporal distribution of the shower.
7. **FPGA (14)**: Processes signals into quantum random bits.
