

AETHYR GLOBAL

Security Audit & Forensic Response Report

Date: March 3, 2026 | Status: FINAL – ISOLATED

1 Executive Summary

This document outlines the findings of a comprehensive security audit conducted following the detection of unauthorized administrative access. The primary objective was to determine the lateral reach of the compromise across the Aethyr Global decentralized infrastructure and evaluate the safety of non-targeted assets.

Primary Finding: The compromise is strictly isolated to one (1) specific contract address. All other operational modules—including the Notary, Licensing, and Liquidity Swap systems—remain 100% secure. Extensive scanning confirms that no other contracts in the ecosystem possess administrative or "Owner" roles that could be exploited.

2 Incident Details: Compromised Entity

A detailed forensic scan identified that only one contract within the environment contained active administrative roles (Owner/Admin) which were targeted in this event.

- **Compromised Address:** 0x4935b6d4D8efacAB084411f5420456d2D67Cc1C8
- **Breach Vector:** Unauthorized access to the Administrative Private Key.
- **Current Status:** Blocked and Blacklisted (Ref: AG-SEC-2026-001).

3 System Integrity: Verified Secure Assets

The audit confirms that the following core modules were **not compromised** and remain fully operational. Their safety is guaranteed by their underlying architectural design.

3.1 Immutable Architecture (Zero-Admin)

Unlike the compromised address, the following contracts were deployed without 'Ownable' or 'Admin' roles. They lack the logic required for any external entity to alter state, redirect funds, or modify permissions. They are effectively "ownerless" and therefore immune to administrative key compromise.

Module	Status	Security Model
Aethyr Notary	SECURE	Immutable Logic (Logic-Locked)
Aethyr Swap Vaults	SECURE	Atomic/Trustless (No Owner)
Licensing Engine	SECURE	Permissionless Verification
Treasury Forwarder	SECURE	Fixed Destination (Hardcoded)

Table 1: Verification of unaffected system modules.

4 Technical Conclusion

The modular separation of the Aethyr Global ecosystem served as a primary defensive barrier. While the address 0x4935... was vulnerable due to its administrative structure, the lateral movement of the attack was structurally impossible.

A thorough scan of the entire network confirms that no other contracts have an owner or admin entry point. The rest of the ecosystem is governed by immutable code rather than human-controlled keys.
